HIGH | Simplify Enhanced Income ETF

OVERVIEW

The **Simplify Enhanced Income ETF (HIGH)** seeks to provide monthly income by selling short-dated put and/or call spreads on a variety of equity and fixed income instruments, which may include indices, ETFs or individual securities.

The fund is intended to be an alternative yield solution as it seeks to provide significant supplemental income to T-bills with low correlation to traditional credit and duration exposure.

A sophisticated option-writing algorithm seeks to sell spreads that generate attractive risk-adjusted returns, while an additional layer of risk management helps manage tail risk associated with selling options.

KEY POINTS

- **Designed as an attractive yield solution with potential for significant income and low correlation to credit and duration risks**
- **Fund writes short-dated option spreads**
- **Sophisticated algorithms seek to generate attractive risk-adjusted returns while limiting tail risks**

STRATEGY DETAILS

- The fund sells short-dated put or call spreads on a variety of equity and fixed income indices, ETFs and/or individual securities
- A sophisticated option-writing algorithm dynamically selects option type, underlier, and strikes to generate attractive risk-adjusted returns
- Automated risk management techniques are also deployed to help mitigate tail risks associated with option selling
- Excess cash is invested in short-dated treasuries

PORTFOLIO APPLICATIONS

- **Attractive Alternative Income:** Selling spreads can be a source of high income with minimal duration risk and low beta to traditional credit, hence this fund can be used as a diversifying alternative to traditional high yield.

PORTFOLIO MANAGERS:

Ken Miller, Portfolio Manager of the Adviser, **Paul Kim**, Chief Executive Officer of the Adviser, and **David Berns**, Chief Investment Officer of the Adviser, serve as portfolio managers of the Fund. Mr. Miller, Mr. Kim, and Mr. Berns are jointly and primarily responsible for the management of the Fund.

DEFINITIONS:

Beta: Slope coefficient of a linear regression between the S&P 500 Index and the underlying asset.

Bloomberg US Corporate High Yield Total Return Index: Measures the USD-denominated, high yield, fixed-rate corporate bond market. Securities are classified as high yield if the middle rating of Moody's, Fitch and S&P is Ba1/BB+/BB+ or below. Bonds from issuers with an emerging markets country of risk, based on the indices' EM country definition, are excluded.

Duration: A measure of the sensitivity of an asset price to movements in yields.

Global Market Portfolio: Represents all assets—stocks, bonds, real estate, commodities, and other investments issued by governments and corporations—weighted in proportion to their relative market values.

ICE BofA US 3-Month Treasury Bill Index: An unmanaged index that is comprised of a single U.S. Treasury issue with approximately three months to final maturity, purchased at the beginning of each month and held for one full month.

Market Price: The current price at which shares are bought and sold. Market returns are based upon the last trade price.

NAV: The dollar value of a single share, based on the value of the underlying assets of the fund minus its liabilities, divided by the number of shares outstanding. Calculated at the end of each business day.

Notional Exposure: The full market exposure a derivatives contract provides after accounting for the leverage embedded in the derivative, expressed as a percentage of the fund's total assets. We assume each option's delta (sensitivity to changes in underlying) is 1 in this calculation, implying that we are measuring the exposure afforded by the options in the instance where extreme markets are being realized. This metric provides a measure of the protection afforded to the underlying security by a given option position.

Option: An option is a contract that gives the buyer the right to either buy (in the case of a call option) or sell (in the case of a put option) an underlying asset at a pre-determined price ("strike") by a specific date ("expiry"). An "outright" is another name for a single option leg. A "spread" is when options are bought at one strike and an equal amount of options are sold at a different strike, all at the same expiry.

SEC 30-Day Yield: The yield is calculated with a standardized formula and represents net investment income earned by a fund over a 30-day period, expressed as an annual percentage rate based on the fund's share price. The yield includes the effect of any fee waivers and/or reimbursements. Without waivers, yields would be reduced. This is also referred to as the "standardized yield", "30-Day Yield" and "Current Yield". The unsubsidized SEC 30-Day Yield does not reflect the effect of any fee waivers and/or expense reimbursements.

IMPORTANT INFORMATION:
Investors should carefully consider the investment objectives, risks, charges, and expenses of Exchange Traded Funds (ETFs) before investing. To obtain an ETF's prospectus or Summary prospectus containing this and other important information, please call (855) 772-8488, or visit SimplifyETFs.com. Please read the prospectus carefully before you invest.

An investment in the fund involves risk, including possible loss of principal.

The fund is actively-managed and is subject to the risk that the strategy may not produce the intended results. The Fund invests in ETFs (Exchange-Traded Funds) and entails higher expenses than if invested into the underlying ETF directly. The lower the credit quality, the more volatile performance will be. When junk bonds sell off, the lowest-rated bonds are typically hit hardest known as blow up risk. Likewise, the riskiest bonds typically rise fastest in a bull market however these investments that don't have a credit rating are typically the most volatile, hard to price and the least liquid.

The use of derivative instruments involves risks different from, or possibly greater than, the risks associated with investing directly in securities and other traditional investments. These risks include (i) the risk that the counterparty to a derivative transaction may not fulfill its contractual obligations; (ii) risk of mispricing or improper valuation; and (iii) the risk that changes in the value of the derivative may not correlate perfectly with the underlying asset, rate, or index. Derivative prices are highly volatile and may fluctuate substantially during a short period of time. The use of leverage by the Fund, such as borrowing money to purchase securities or the use of options, will cause the Fund to incur additional expenses and magnify the Fund's gains or losses. The Fund's investment in fixed income securities is subject to credit risk (the debtor may default) and prepayment risk (an obligation paid early) which could cause its share price and total return to be reduced. Typically, as interest rates rise the value of bond prices will decline and the fund could lose value.

While the option overlay is intended to improve the Fund's performance, there is no guarantee that it will do so. Utilizing an option overlay strategy involves the risk that as the buyer of a put or call option, the Fund risks losing the entire premium invested in the option if the Fund does not exercise the option. Also, securities and options traded in over-the-counter markets may trade less frequently and in limited volumes and thus exhibit more volatility and liquidity risk.
